The Customer Journey: Support Portal Flow

Screen 1: Dashboard (The Home Screen)

The Story: When the software client (e.g., a franchise manager or construction project lead) logs in, they land on a central hub. This screen gives them immediate visibility into their support history and a quick way to get help.

- The dashboard shows the customer their own opened tickets, their total raised tickets, and their closed tickets.
- There is a shortcut button to "open ticket" right on the home page.
- An AI agent is available to register some frequent tickets.
- Customers receive push notifications here for any change by the admin side (e.g., updating statuses to "acknowledged" or "in progress," or when an in-app conversation message is sent).
- An analytics screen is accessible to the user.
- **System Status Banner:** Add a global banner at the very top. If your web app or cloud database is experiencing an outage, display it here so customers don't flood the system with "app won't load" tickets.
- **Knowledge Base Search Bar:** Place a prominent search bar above the "open ticket" button. This encourages users to search for quick fixes before raising a ticket.

Screen 2: Knowledge Base / Help Center *(NEW SCREEN)*

The Story: If the customer uses the search bar on the dashboard (or clicks a "Help Articles" tab), they are taken to a self-service library of tutorials, FAQs, and release notes about your software.

- **Categorized Article Library:** Group articles by product or module (e.g., "Web App Dashboard," "Mobile App Syncing," "Billing & Accounts").
- **Video Tutorials:** Allow embedding of short video walkthroughs for complex software workflows.
- **"Did this answer your question?" Toggle:** At the bottom of every article, include a Yes/No button. If they click "No," automatically reveal the "Raise Ticket" button, seamlessly transitioning them to the next step.

Screen 3: Raise Ticket (The Submission Form)

The Story: If the Knowledge Base didn't help, the customer proceeds to a dedicated submission form to report their specific software bug or usage question.

- This is a separate screen dedicated to opening tickets.
- The form includes required fields where the user must type their organisation name, subject, and description of the problem.
- It includes a category dropdown mentioning "web" or "mobile".
- It includes a priority dropdown with "High, Medium, low" options.
- There is a photo attachment feature for better understanding.
- **Auto-fill Organisation Data:** The "organisation name" field should auto-fill based on their logged-in profile.
- **Dynamic Software Environment Fields:** If they select "Web" from your category dropdown, dynamically show a field asking for "Browser (Chrome, Safari, Edge)." If they select "Mobile," dynamically ask for "OS (iOS or Android)."
- **Screen Recording Hint:** Next to your photo attachment feature, add a text hint: *"Tip: Attaching a screen recording of the bug helps us solve it faster!"*

Screen 4: My Tickets (List View & Chat Interface)

The Story: After submitting, or when checking on an old software issue, the customer goes to a list of all their requests and can click into a specific one to chat with support.

- This screen displays both resolved and pending tickets, with pending tickets showing up in a list view.
- Inside the ticket, there is a conversational chat for every ticket.
- This chat helps to confirm from the client whether the software issue is resolved before closing.
- Once the ticket is resolved and closed by the admin side, the customer should not be able to message, and the chat should be closed.
- Once closed by the admin side, the customer sees a message to rate the service.
- **List Filters:** Add a filter dropdown on the list view so a client can sort by "Open," "Waiting on Me," or "Closed."
- **"Re-open" Button (Bug Recurrence):** Software bugs often reappear after an update. Give them a button to re-open a closed ticket within a 48-hour window so they don't have to explain the whole bug from scratch.

Screen 5: Profile (Settings)

The Story: The customer needs a place to manage their identity and contact information to ensure support agents know exactly who they are talking to.

- A profile screen allows the customer to change their name, password, emails, their organisation name, and their number.
- **Notification Preferences:** Add toggle switches here letting the user choose *how* they want to be notified of ticket updates (e.g., “WhatsApp me when a ticket is updated" or "Send me a push notification").

The Admin & Developer Journey: Final Blueprint

Screen 1: Global Admin Dashboard (The Command Center)

The Story: The first thing an admin sees upon login. It provides an immediate pulse on the health of your software support operations and identifies which client organizations are experiencing the most friction.

- Displays top-level KPIs: Open tickets, Response time, and Tickets Resolved Today.
- Shows a "Recent Activity" feed of newly raised tickets.
- **Organization-Wise Navigation:** A sidebar or widget showing ticket counts broken down by brand/organization. Clicking an organization filters the view to show only their raised and resolved tickets.
- **System Status Toggle:** A quick toggle to activate the "System Outage" banner that pushes to the customer's dashboard if your web or mobile app goes down.
- **Live SLA Breach Alerts:** A flashing indicator showing exactly how many active tickets have breached their promised resolution time.

Screen 2: The Ticket Queue (Triage & Assignment)

The Story: The sorting facility. Tickets arrive here, are labeled, and are handed out to the right developers based on priority.

- **Push Notifications:** Admins get a push notification the moment a new ticket is raised.
- **SLA Sorting (First-In-First-Out):** The list defaults to a FIFO concept so older tickets are resolved first.
- **Priority Badges:** Highly visible badges indicating the priority scale (High, Medium, Low).
- **Queue Views:** Dedicated tabs to easily switch between "Unassigned Tickets" and "Assigned to Me."
- **AI Auto-Labeling:** The system scans the customer's description and automatically labels the bug type (e.g., Functionality, UI/UX).
- **Assignment & Handoff:** Admins can see who is currently attending a ticket and can re-assign it (triggering a push notification to the new developer).
- **SLA Color Coding:** Rows dynamically turn yellow (approaching SLA breach) or red (breached SLA) based on strict time limits.
- **Bulk Actions:** Checkboxes next to tickets allowing an admin to select 10 tickets at once and assign them all to one developer or close them simultaneously (crucial during a server outage).

Screen 3: Ticket Resolution Workspace (The Developer View)

The Story: The split-screen workspace where developers actually fix the software bug, communicate with the client, and log their work.

- **Clarification Mode:** Developers can mark a ticket as "Needs Clarification" and start an in-app chat with the client.
- **Ticket Status Lifecycle:** Developers manage the state machine (Open $\rightarrow$ Acknowledged $\rightarrow$ In Progress $\rightarrow$ Resolved).
- **WhatsApp Integration:** Any status updates made to the ticket trigger an automated WhatsApp alert to the client.
- **System Context Panel:** The customer's dynamic data (Browser, Mobile OS, App Version) is permanently pinned to the right side of the screen.
- **Internal Notes (Whisper Mode):** A toggle allowing developers to leave private, color-coded notes that the customer cannot see.
- **Macros (Canned Responses):** A dropdown to insert pre-written replies for frequent questions (e.g., "Clear your cache," "Reset your password") to save typing time.
- **Dev-Issue Linker:** A button to link this specific support ticket to an actual GitHub issue or engineering backlog task.

Screen 4: Automations, SLAs, & Routing

The Story: As your company grows, admins cannot manually assign every ticket. This screen tells the system how to manage itself.

- **SLA Policy Manager:** A screen to define rules (e.g., "High Priority tickets must be Acknowledged in 1 hour; Low Priority in 24 hours").
- **Routing Rules Engine:** IF/THEN logic setup. (e.g., *IF* Organization = 'Mining Corp A', *THEN* auto-assign to 'Developer John').

Screen 5: Reports & Analytics

The Story: The retrospective screen where management reviews SaaS stability and team performance.

- **Core Metrics:** Shows Average Resolution Time, First Response Time, Total Resolved, and Customer Satisfaction (CSAT) rate.
- **Organization Metrics:** Identifies the "Top Organizations by Tickets" to see which clients are struggling the most.
- **Priority Distribution:** Shows the ratio of High vs. Low priority tickets.
- **Bug Category Heatmap:** Using your AI labels (UI/UX vs. Functionality), a chart showing exactly which parts of your application are causing the most support volume.

Screen 6: Knowledge Base CMS (Content Management)

The Story: The backend editor for the customer-facing Help Center.

- **WYSIWYG Editor:** A rich text editor for developers to write FAQs, format code snippets, or embed video tutorials.
- **Deflection Analytics:** Data showing which articles successfully stopped customers from creating a ticket, and which articles failed.

Screen 7: Team & System Settings (Configuration)

The Story: The global configuration hub for managing the support staff and external integrations.

- **Developer Performance (Auditing):** Admins can view individual active developers, tracking their specific average response times and current active ticket load.
- **Role-Based Access Control (RBAC):** Define what a 'Viewer' vs 'Agent' vs 'Admin' can do.
- **API & Webhook Integrations:** The dedicated space to manage the WhatsApp API keys, email forwarding rules (e.g., routing support@yourcompany.com into the portal), and push notification configurations.
